Data Science Team

Case Study & Background

Case Study

- A Client Advisor at Marsh wants to accelerate the creation of client-specific marketing pitches for insurance policies.
- You are hired as a consultant to build a UI-driven, AI-powered application.
- The application generates a tailored marketing pitch presentation for any client company.
- The pitch must be grounded in the 4 medical policy documents shared with you.

Background

- Advisors spend significant time manually researching client companies and curating policy content for pitches.
- Policy documents outline coverage, benefits, exclusions and pricing that must be accurately reflected.
- Inaccurate or unsupported coverage claims create commercial and compliance risk for the firm.
- A tool is needed where an advisor inputs a company name and instantly gets an accurate, well-structured pitch grounded in policy documents — with confidence the AI content has been checked.

Challenge 1: Build the AI-Powered Pitch Generator

Develop a UI-driven application that generates a client-specific marketing pitch for Marsh's insurance policies.

- Objective 1.1 — UI: input field for company name, ability to select/upload policy document(s) as baseline, and a generate button.
- Objective 1.2 — `generateCompanyProfile(company_name)`: gathers company info (industry, size, key risks); falls back to clearly-labelled assumptions if data is unavailable.
- Objective 1.3 — `generateMarketingPitch()`: produces a 3–5 slide deck covering company overview, why choose Marsh, policy benefits mapped to exposures, and one final recommended policy.
- Objective 1.4 — input validation and error handling for missing company name, missing documents, or generation failures.

Challenge 2: Audit the AI-Generated Content

AI-generated pitch content carries a risk of inaccurate, unsupported or fabricated claims about policy coverage ("hallucination").

- Before any pitch reaches a client, the firm needs confidence every benefit and figure is grounded in the source policy documents.
- Objective 2.1 — build an auditing layer that traces each claim to a specific policy clause and flags untraceable statements for human review.
- Objective 2.1 (cont.) — produce an audit summary (e.g. confidence score or pass/fail flag) alongside the generated deck.
- Objective 2.2 — implement `auditPitchContent(pitch_slides, policy_docs)` returning a structured audit report, and describe how the advisor uses it to approve, edit, or reject the pitch.

Expected Submissions

Deliverable	Description
Working application	UI + backend/notebook code implementing the pitch generator and audit layer.
Sample pitch deck	At least one generated 3–5 slide PowerPoint pitch for a chosen company.
Audit results	Audit report/output for the sample deck(s), showing traceability of claims to source policy documents.
Write-up	Short Word/PDF summary covering approach, tools/libraries used, and key design decisions.

Thank You
